Logical Flow Example

1) Client 1, which is presenting a BoardView to the user, sends a request to drop a disk in column 3.

2) The request is granted by the Server. (During this time, the Server has locked out Client 2, waiting only for requests from Client 1.

3) Server alerts the clients to update their views based on tthe granted move.

4) Now Client 1 is locked out, and the server waits on Client 2 to send a move request.
